

Perl Homework #1

Create one program with many small subroutines. Your main program should just call each subroutine.

Subroutines are:

- 1) Ask the user to enter a conversion rate to English currency and a dollar amount. Print the converted amount.
- 2) Ask the user to enter a number. Print all the numbers up to that number. Then print the total of all printed numbers.

This next one will be moved back to another homework.

- 3) Roll a die using a random number using `int (rand (6))`, which gives you a number between 0 and 6 and then converts it to an integer, so 0-5 results. Add 1 to the result to get 1-6. Print the roll. Keep rolling until you get two 5's in a row.
